

Services for every AI ambition

Services for AI factories

What is an AI factory?

Imagine a traditional manufacturing factory where raw materials are transformed into finished goods, ready to be shipped to customers. There are multiple stages, each requiring specific tools, skills, and processes. Now, compare this to an AI factory, which transforms data into actionable insights, predictions, automated activities, and intelligent solutions. The same concept applies — each stage of the AI lifecycle requires specialized tools, skills, and processes.

AI factories industrialize the process of turning raw data into intelligence — and intelligence into valuable outcomes that drive organizations forward faster.

Integration is a key to success

Building an AI factory isn't just about deploying advanced technologies. It requires a fully integrated approach that includes people, processes, and technology — from data center facilities to AI workloads.

Turning AI investments into business value

Until recently, artificial intelligence (AI) was used by some organizations to support some workloads some of the time. Today, organizations of all types and sizes can use AI strategically to support practically any task. As such, a new approach is necessary — one that enables continuous AI development, deployment, and advancement.

Enter the AI factory, designed to build, train, and deploy AI at scale rapidly. By integrating data pipelines, model development environments, and deployment frameworks, AI factories not only streamline AI development but also optimize day-to-day operations. The more the AI factory is used, the more data it receives, and the better its algorithms become.

Strategic importance of AI factories

AI factories offer organizations a competitive advantage due to faster innovation, increased operational efficiency and scalability, and more control over data. Organizations that invest in AI-driven solutions can look forward to receiving important business benefits:

- Increasing efficiency and maximizing resource utilization
- Quickly responding to market demands and gaining a competitive advantage
- Making smarter, data-driven decisions

The AI factory journey

If designing and delivering an AI factory appears too daunting, HPE Services is here to help. Designed to streamline the AI lifecycle, HPE Services focuses on the challenges organizations face during AI adoption and operational integration. By addressing gaps in people skills, processes, and technologies — from the data center facility to individual AI workloads — HPE Services experts can help you deploy an AI factory at scale and speed your time to business outcomes.

You can count on HPE Services to deliver the enterprise-grade services you need during every phase of your AI factory journey, from day -1 through day 2, assisting you with:

- **Strategy:** Understand your organization's AI needs, goals, and constraints
- **Design:** Determine the right AI architecture, assess risk, and create a plan
- **Finance:** Secure funding for your AI factory project
- **Deployment:** Ease the burden of getting your AI factory up and running
- **Technical training:** Build the critical AI skills that drive business success
- **Management of change:** Overcome people- and process-related roadblocks
- **Support:** Reduce the complexity of managing day-to-day AI operations
- **Managed Services:** Free up your staff while HPE manages your AI environment
- **Refresh:** Upcycle your old technologies

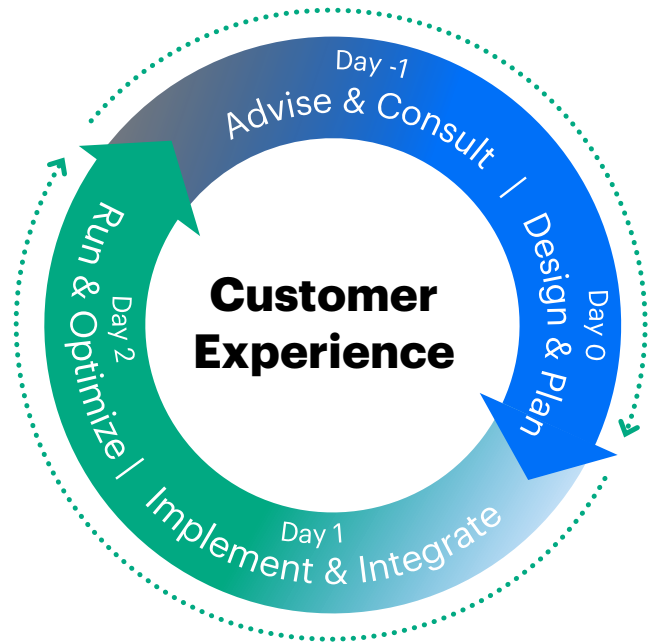

Figure 1. This is an image illustrating the phrases of the AI journey.

Providing services across all AI factory infrastructure tiers

The AI factory journey involves creating and operating multiple tiers, each tailored to address specific challenges and opportunities. With expertise and experience helping customers build their AI factories from the ground up, HPE Services can help you build and operate all the tiers of your AI factory.

Tier 1: Data center facility. HPE Data Center Services provides planning and design engineers who work with your organization to develop your data center facility paths. Designed specifically for AI use cases, the HPE Data Center Services — AI Mod POD pairs preconfigured modular infrastructure with technology solutions for AI, optimized to deliver the performance and flexibility required for AI — while typically being 30% less expensive in terms of dollars per kilowatt of IT capacity.¹

Tier 2: Infrastructure. Infrastructure is the backbone of AI factories. Servers, storage, and networking technologies must be implemented efficiently and managed over time for optimization. HPE and its partners offer products and services for efficient operations, including scalability, reliability, and review processes. HPE Lifecycle Services range from factory integration to on-site installation and start-up. Services are available to help you build and integrate complex solutions into your environment. HPE also offers performance benchmarking capabilities for large-scale AI cluster deployments.

Tier 3: Operating layer. The operating layer blends operating systems across all tiers, facilitating seamless collaboration and integration of AI workloads. Apart from straightforward operating system deployment, HPE also offers validated/optimized golden operating system images for the platform that can be deployed to maximize performance of the environment. In addition, HPE provides automated operating system and container platform deployment services to assist customers who want to enhance and streamline their operations, as well as reduce provisioning times in large-scale environments.

Tier 4: Control plane, automation, and orchestration. HPE instantiates a control plane for AI infrastructure, with robust cybersecurity measures and resilience incorporated. The control layer includes systems lifecycle monitoring, observability, and cost/energy efficiency management. Software integration services bridge the gap between existing IT environments and AI factory environments. HPE Cloud Platform Services—Unified Cloud Management provides experts to help you implement your factory's control plane. HPE Complete Care Service — ITOps allows you to take advantage of HPE OpsRamp to increase visibility into your operations. And HPE Managed Services can manage your control plane for you, so you can focus on your business.

Tier 5: Applications and AI workloads. Delivered via software as a service (SaaS), these applications can manage the entire model development lifecycle in a systematic manner: data exploration, data pipeline creation, feature preparation, model training, model optimization, model versioning, model integration, model deployment, testing, and model monitoring. HPE Data Services and HPE AI Services — Generative AI Implementation can help guide you through each of these steps and to the point of producing high-quality output for your business.

Let's get to work

If your organization is ready to begin its AI factory journey or needs help moving its AI initiatives forward, HPE is here to help. Visit [HPE.com/services](https://hpe.com/services) to learn more about:

- HPE AI Services
- HPE Data Services
- HPE Cloud Platform Services
- HPE Cybersecurity Services
- HPE Data Center Services
- HPE IT Sustainability Services
- HPE Networking Services
- HPE Transformation Services
- HPE Lifecycle Services
- HPE Managed Services
- HPE Complete Care Service
- HPE Financial Services
- HPE Education Services
- HPE HPC AI Services
