

What are Deep Agents?

Let's dive in

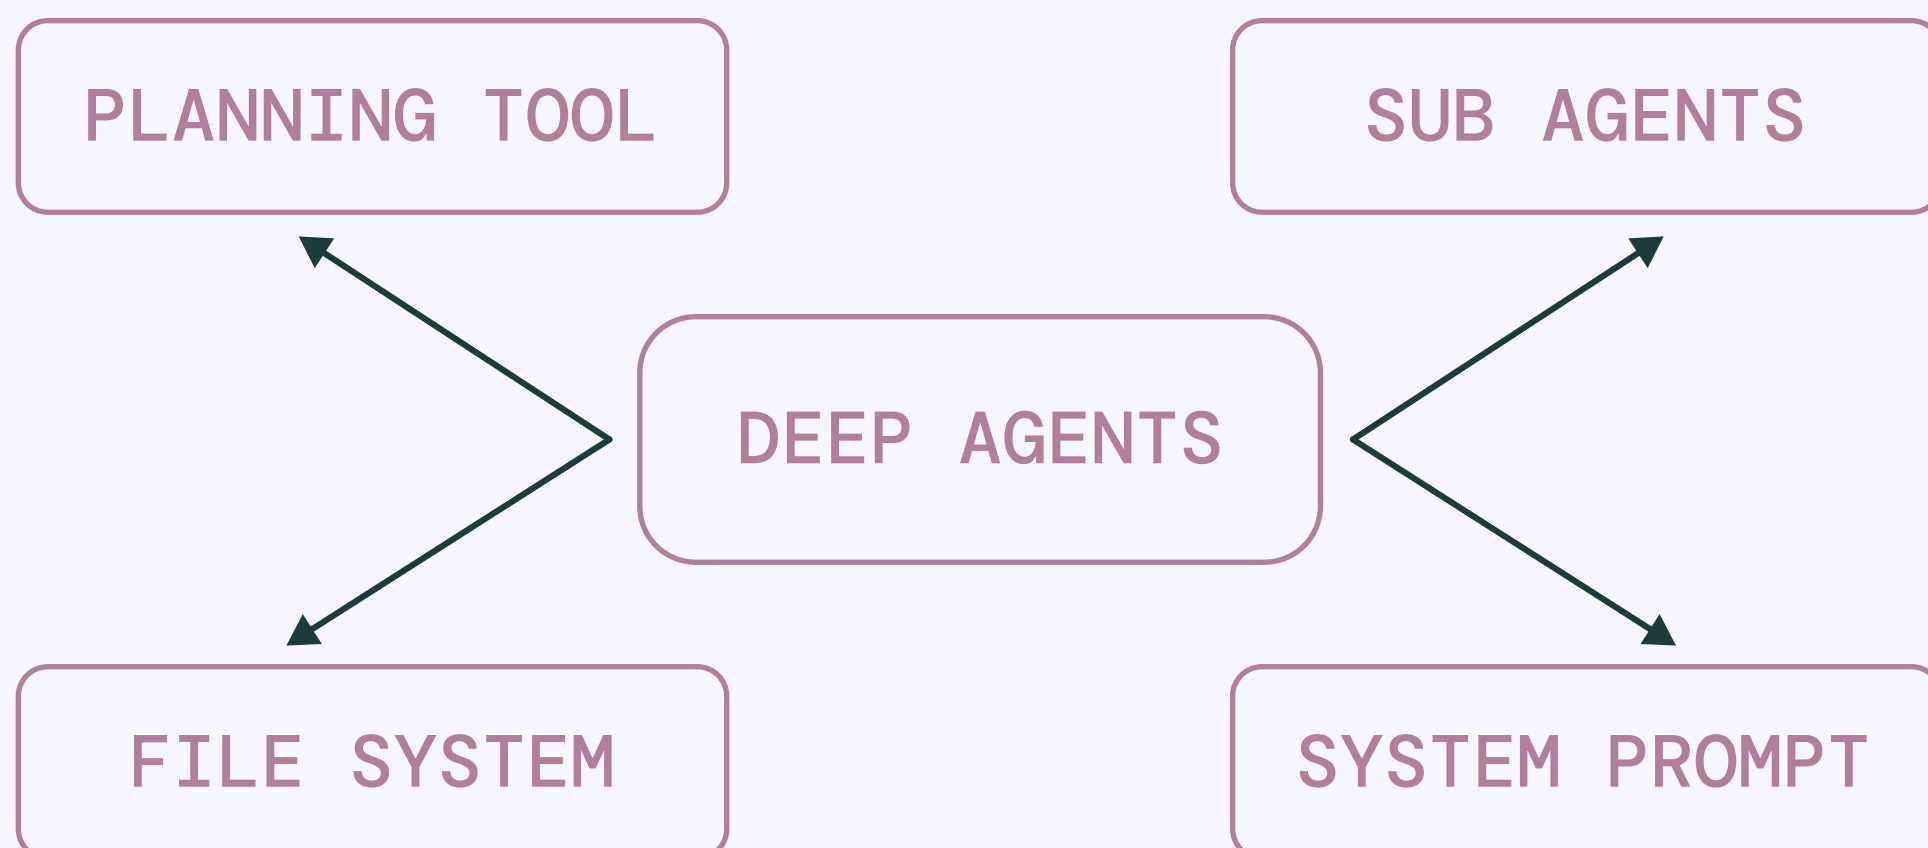

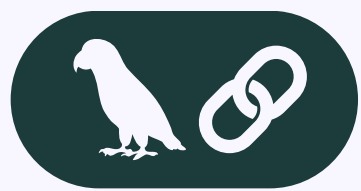

LangChain

Deep agents can do complex, multi-step tasks over long time horizons, like Claude Code.

They have 4 characteristics:

- [01] Detailed system prompt
- [02] Planning tool
- [03] Sub agents
- [04] File system

LangChain

Detailed system prompt

Deep agents have long, complex system prompts, including details like:

- Instructions on how to use tools
- Examples for how to behave (few shot prompts)

Planning tool

Deep agents manage context using a planning tool to:

- Break complex tasks into steps
- Track progress
- Adapt plans as new information emerges

Sub agents

Deep agents split up tasks and delegate work to specialized agents.

This structure:

- Isolates subagent context for deep work
- Keeps supervisor context clean

File System

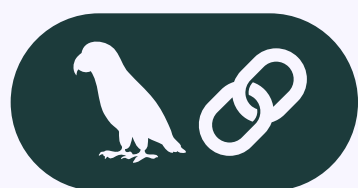

Deep agents run for long periods of time and accumulate a lot of context.

A file system for memory enables:

- Manage large amounts of context
- Persistent memory across conversations and threads
- Collaboration for all agents (and subagents)
